Top tips for making a success of SOSR

Variety choice

Choose a vigorous variety that can get away quickly to out-compete spring weeds.

Varieties with high oil content can help growers take advantage of premiums

Drill at the right time

Resist the temptation to drill too early. Late March or early April are best when soil temperatures are warm enough to give the crop a quick start

Agronomy

Use a residual herbicide to remove early weed competition. Monitor and treat for cabbage flea beetle and pollen beetle.

Apply split doses of N between 100kg/ha and 150kg/ha at sowing time and at emergence

Use slightly higher seed rates than for WOSR

Drill @ 80 to 90 seeds/m² to achieve a population of 70 seeds/m²
